Istanbul, Beylikdüzü | Software Engineer

Focusing on DevOps and System Security, I am a senior Software Engineering student with practical experience in Linux (Arch/Debian) and Docker ecosystems, passionate about process optimization and secure system operations.

Experience

Fatih Sultan Mehmet Vakıf University | July 2026 – August 2026

Software Engineering Intern

- Conducted security tests (Pentest) on the institution's web infrastructure using Nmap, OWASP ZAP, and Nuclei, reporting Clickjacking and CSP vulnerabilities.
- Developed CLI automation tools and SSRF-protected microservices for the Coolify PaaS infrastructure using Rust (Axum), Bash, and Docker.
- Developed the Flutter-based campus mobile application (OBS, QR ID) and set up the GitHub Actions CI/CD deployment pipeline.

Koroplast

IT Intern

- Successfully managed workstation setup, OS provisioning, and VDS management processes.
- Ensured the continuity of the physical infrastructure, including network peripherals and CCTV systems.

Technical Skills

- **System and DevOps:** Linux (Debian/Arch), Docker, Docker Compose, Traefik Reverse Proxy, Coolify PaaS, Infrastructure as Code (IaC), Shell Scripting (Bash), PostgREST.
- **Security and Cryptography:** AES-256-GCM Encryption, OAuth2 PKCE, JWT Authentication, Rate Limiting / Brute-Force Mitigation, Zero-Knowledge Concepts, UFW, SSH Key Management, Pentest.
- **Programming & Database:** Rust (Tokio/Axum), Python (TensorFlow), TypeScript/Node.js, C/C++, SQLite, PostgreSQL, Drizzle ORM, Flutter.

Projects & Achievements

- **Orchestration & Container Security:** With the Supabase Local Orchestrator project, I established an isolated Pod architecture using Docker Engine API and Traefik Reverse Proxy, consuming ~35MB RAM per tenant; zeroed out leakage risks by dynamicizing JWT and password distribution.
- **Secure Coding (Rust):** In the Mailora and CloudMulti projects, I developed a memory-safe IMAP server and an API Gateway with AES-256-GCM encryption, leveraging the memory safety advantages of the Rust language.
- **Digital Inheritance & Emergency Protocol (Rust):** I designed and prototyped an emergency recovery system (Vault) with a Dead Man's Switch architecture that automatically transmits encrypted backup instructions and access portals to family members via automated messages (SMS/WhatsApp/Mail) when no signal is received from the user for 7 days.
- **Cloud Provisioning Automation:** With the OCI Hunter project, I transformed Oracle Cloud resource provisioning processes into Bash and OCI API automation, creating a 24/7 uninterrupted infrastructure scanning and Telegram alert system.

Education

Beykent University (Istanbul) | Bachelor's in Software Engineering | September 2022 – June 2026
